Addressing Rising Drug Prices

At CVS Health®, we recognize that one of the most important things we can do is to help people afford and take their medications.

Rising drug prices hurt patients and lead to negative and costly outcomes throughout our system.

40% of patients do not pick up their prescriptions when out-of-pocket costs per prescription exceed $200.1

$290B in wasteful spending due to patients not taking their medications as prescribed.2

Providing information across all points of care helps patients get the right medicine at the lowest possible cost:

100K prescribers currently use real-time benefits (RTB) for Caremark members.

57% of Americans don’t know how much a drug will cost them before filling a prescription.

54% of Americans believe it would be helpful to know the cost of a prescription before it is filled.3

At the Physician’s Office

RTB technology provides prescribers with visibility into what a patient will pay for a specific drug under their benefits plan and presents up to five lower-cost, clinically-appropriate alternatives for consideration by the prescriber.

At the Pharmacy Counter

30K retail pharmacists use the Rx Savings Finder to search for potential savings opportunities.

On Demand

230K times a month, Caremark members are searching the CheckDrugCost tool to locate lower-cost, clinically-appropriate alternatives.

Our Pharmacy Benefit Management (PBM) strategies are helping control costs while promoting better health:

- Encouraging the use of lower-cost alternatives
- Zero-dollar copay drug lists
- Evidence-based utilization
- Rebates at the point of sale

Without PBM strategies, health care costs would rise for patients, employers and government programs:

Brand drug manufacturers have been increasing prices on average 9.2% annually from 2006-2016.6

In spite of these steady price increases, CVS Caremark has kept drug costs in check for clients and patients.
